PlainTextClipboard Free License Key PC/Windows

Publisher's Description: When you copy or cut text from a program, document, or website, the formatting of that text remains on your clipboard. This presents a problem, because it makes it hard to paste the text into another program. If you don't want to lose the formatting, you can paste the text into a plain text editor. Or, you can use PlainTextClipboard to automatically clear the text's formatting on your clipboard. All you have to do is use the application and choose the formatting you want to remove from the copied text. The application will clear the following formatting: Formatting for tables Formatting for headers Formatting for lists Formatting for pictures Formatting for tables To clear the formatting of a table, choose the table from the application's text, and then choose Clear Formatting for Tables. To learn more about the different formats of tables, see Tabular Formats. Formatting for headers To clear the formatting of a header, choose the header from the application's text, and then choose Clear Formatting for Headers. To learn more about different formats for headers, see Headers. Formatting for lists To clear the formatting of a list, choose the list from the application's text, and then choose Clear Formatting for Lists. To learn more about the different formats for lists, see List Formats. Formatting for pictures To clear the formatting of a picture, choose the picture from the application's text, and then choose Clear Formatting for Pictures. To learn more about the different formats for pictures, see Picture Formats. Actions: Copy Selected Text -> Clear Formatting -> Clear Formatting for Text -> Clear Formatting for Headers -> Clear Formatting for Lists -> Clear Formatting for Tables -> Clear Formatting for Pictures For more information: Open Windows Explorer and choose Edit -> Select All. Then press the Delete key to clear the text and choose Edit -> Copy to clear the formatting. When you copy or cut text from a program, document, or website, the formatting of that text remains on your clipboard. This presents a problem, because it makes it hard to paste the text into another program. If you don't want to lose the formatting, you can paste the text into a plain text editor. Or, you can use PlainTextClipboard to automatically clear the text's formatting on your clipboard. All you

What's New In?

Unobtrusive application that can be initiated using either the desktop shortcut or predefined hotkeys PlainTextClipboard features a swift installation process that will not trouble users with extensive configuration or setup. The application can be initiated by using either the desktop shortcut, its Start menu entry or the predefined, "Ctrl + Alt + T" keyboard shortcut. Once they have some formatted text copied on their clipboard, users can run the application and it will automatically clear the formatting of the copied text. This can be verified by simply pasting the copied text into another, unformatted document. Nevertheless, in case users already have the "Ctrl + Alt + T" keyboard shortcut assigned to other applications, the utility will not work. The developer advises them to use the function keys present on their keyboards (if applicable) or special, configurable keys. Useful application that will allow one to clear the formatting of copied text in just three keystrokes. Those who work with large volumes of information and copy / paste text strings frequently might find a viable solution in PlainTextClipboard. It will offer them the ability to easily remove the formatting of the copied text, in order to prepare it for further use. Eliminating the need for additional plain text editors for cleansing the text, this application will increase users' work efficiency. Version 1.2, February 25, 2013 - Minor Updates Q: How to set vim as default editor in open-ssh I have configured open-ssh to use vim as the default editor with this command: `vi /usr/local/bin/autossh` which in turn is defined in the `ssh_config` file: `Host * User * PreferredEditor /usr/local/bin/autossh` However, even if I set the filetype for * to vim in my `vimrc`, it is still not used when I connect via ssh. Is there any way to achieve this? A: As an addition to Daniel's answer: Have a look at the 'editor' configuration directive. It has a default value of "vi" which means that if there is no user specified value, vi will be used. PS: have you tried `ssh -t *` (which enables terminal forwarding) so that your session behaves like it is running on the remote host? A: Don't just edit the `ssh_config` file as it will only apply to the current session. Instead, add an entry to the `~/.ssh/config` file on your local machine. This will set the default editor on all future SSH connections to whatever filetype you put in there.
