See, for example, U.S. Pat. No. 4,192,281, the contents of which are incorporated herein by reference, and commonly assigned U.S. Pat. No. 4,019,498. For example, a Foley catheter, which is one type of urinary drainage catheter, may include a drainage tube in its distal end which is delivered through the urethra of the patient to the bladder. A balloon located at the patient end of the catheter is inflated to seal the urethra and the proximal end of the catheter is taped to the patient's skin. The catheter is designed to be left in place from about 4 to about 7 days. Foley catheters are used to drain urine from the bladder to a convenient drain tube from which it can be withdrawn periodically. A Foley catheter may be introduced by way of the urethra of the patient and passed through the urethra, the bladder and the ureter, and into a drainage tube. Foley catheters have been described in various sizes. Catheters used with male patients have relatively small drainage tubes, typically from about 1 to 2 mm in diameter. Catheters used with female patients often have drainage tubes which are slightly larger, typically from about 2 to 3 mm in diameter. Catheters can be of a variety of lengths, but commonly are from about 150 cm to about 200 cm in length. The problems associated with indwelling Foley catheters are well known and include a number of problems associated with displacement or migration of the catheter, such as kinking of the catheter, infection, bladder injury, and a variety of other difficulties
